The **SAFE-T-SIGN** is a highly reflective emergency stop sign for pull wire systems. The sticker's high-grade reflective material and the UV stable ink used to print the design on the material, ensures high visibility and durability in any environment. Being reflective makes for safer pull wire systems, especially in the dark, allowing users to see the information clearly and easily. The backing is manufactured from either 304 stainless steel or polypropylene plastic. With one 13mm mounting hole or pull wire mounting clip, the sign is simple to install on existing or new rope guides or pull wires. The Australian Standard AS4024.3610 Clause 2.10.6.1 states that signs should be installed at the head, tail, and any transfer point and at no more than 30m intervals wherever a pull wire is situated along a conveyor.
